CS 19300 PROJECT SPECIFICATION • CLI TOOL

wax — Feature Eisenhower Matrix

A lightweight command-line tool for cataloging vinyl records via Discogs, browsing your crate, and picking what to play.

This Eisenhower Matrix prioritizes features for `wax` to ensure a focused, high-impact Command-Line Interface (CLI) Minimum Viable Product (MVP) built around frictionless Discogs cataloging, fast terminal crate browsing, and deciding what record to put on the turntable.

PRIORITY AXIS	URGENT	NOT URGENT
IMPORTANT	**Do - (Your MVP)** • **Discogs Auto-Cataloging (Add / Remove):** Search the Discogs API from the CLI (`wax add "Query"`) to pull artist, title, year, genres, styles, and tracklist into a local JSON database without manual typing. • **Fast Crate Browser & Filtering:** Browse and search your collection (`wax browse` / `wax list`) by genre, style, artist, decade, or track title, and inspect full album tracklists in the terminal. • **"What to Play" Selector:** A picker command (`wax pick`) that selects an album to put on the turntable—either completely at random or filtered by criteria like `--genre rock` or `--decade 70s` .	**Schedule - (For V2.0+)** • **Custom Vibe & Mood Tags:** Tag records with custom labels (e.g., `study` , `late-night` , `upbeat` , `rainy`) so `wax pick --vibe chill` matches the exact room atmosphere. • **Discogs Account Collection Import:** One-command bulk sync (`wax import --user <username>`) to pull an existing Discogs user profile's entire vinyl folder locally. • **Git-Backed Crate Backup:** A built-in shell wrapper (`wax sync`) that commits and pushes your local collection JSON file to a private GitHub repo for safekeeping.

PRIORITY AXIS	URGENT	NOT URGENT
NOT IMPORTANT	**Delegate - (Use a library)** • **Discogs API Client & HTTP Requests:** Use existing wrappers like `python3-discogs-client` / `requests` (Python) or `disconnect` / `axios` (Node.js) to query Discogs releases. • **CLI Argument & Interactive Prompts:** Delegate flags, subcommands, and interactive selection menus to libraries like `Typer` / `Questionary` (Python) or `Commander` / `Inquirer` (JS). • **Terminal Formatting & Tables:** Use `Rich` (Python) or `Chalk` + `cli-table3` (JS) to render clean, color-coded album tables and tracklist panels.	**Delete - (Cut it)** • **Listening History & Play Count Logs:** Cut spin timestamps and play-count tracking— `wax` isn't playing the audio, it only exists to browse the shelf and pick a record. • **Market Price & Valuation Tracking:** Cut resale prices, marketplace scraping, and collection dollar value estimates. • **Desktop GUI or Audio Playback:** Strictly command-line browsing and selection; no graphical windows, web servers, or digital audio streaming integrations.

Proposed MVP Command Reference

Command	Action
`wax add "Artist - Album"`	Searches Discogs, lets you pick the matching album release, and saves its metadata & tracklist locally.
`wax list [--genre / --decade]`	Displays your collection in a scannable table filtered by artist, genre, style, or release decade.
`wax show "Album"`	Opens the detailed view for a record in your collection (Side A/B tracklist, runtime, year, styles).
`wax pick [--genre / --style]`	Selects and displays a record from your collection to spin right now based on your filter flags.
`wax rm "Album"`	Removes a record from your local collection file.
